

The CPU (Central Processing Unit)

The CPU is the primary brain of the computer. Its main function is to **execute instructions and process data**.

Core Functions

- **CPU (The Brain):** Processes data, executes instructions, and handles all heavy calculations.
- **Chipset (The Traffic Controller):** Manages data flow between the CPU and slower components like storage, USB ports, network, and audio.

Opening Spotify (Step-by-Step)

1. **The Input:** You click Spotify; the **chipset** registers the click and alerts the **CPU**.
2. **The Fetch:** The **CPU** tells the **chipset** to grab the app files from your SSD/HDD.
3. **The Load:** The **chipset** loads those files into RAM so the **CPU** can rapidly run the app.
4. **The Stream:** The **CPU** tells the **chipset** to use the network card to fetch your music stream from the internet.
5. **The Output:** The **CPU** decodes the music file, and the **chipset** routes the audio straight to your speakers or headphones.
