

Let's look at connecting a **Webcam** via a **Wired USB connection**, which is the quickest and most reliable setup for a laptop or PC.

Step 1: Physical Placement

- Mount the webcam securely on top of your monitor or laptop screen using its adjustable clip, or place it on a small desktop tripod.

Step 2: Plug in the USB Cable

- Take the webcam's built-in cable (usually **USB-A** or **USB-C**) and plug it directly into an open USB port on your computer. Avoid using unpowered USB hubs, as webcams need a stable power supply.

Step 3: Automatic Driver Installation

- Modern operating systems (Windows and macOS) are **Plug-and-Play**. Your computer will instantly recognize the hardware, display a brief notification, and automatically install the necessary background drivers within seconds. No extra software download is required for basic functionality.

Step 4: Permissions & Testing

1. **Windows:** Go to *Settings > Privacy & security > Camera* and ensure "Camera access" is turned **On**.
2. **Mac:** Go to *System Settings > Privacy & Security > Camera* and check the box next to your apps to grant access.
3. Open your video app (like Zoom, Microsoft Teams, or Google Meet), head to its video settings, and select your new webcam from the camera dropdown list to test the feed.
