

After disconnecting the phone (or other device) from the Wi-Fi network, the ping from the laptop will usually fail.

What to do

Step 1

Disconnect the device

Turn off Wi-Fi on the phone or disconnect it from the network.

Step 2

Run ping again from the laptop

Command

```
ping 192.168.1.105
```

Replace with the disconnected device's IP address

Typical error message

Windows output

Most common

Example

```
Pinging 192.168.1.105 with 32 bytes of data: Request timed out. Request timed out. Request timed out. Request timed out. Ping statistics for 192.168.1.105: Packets: Sent = 4, Received = 0, Lost = 4 (100% loss)
```

Meaning of the error

Error	Meaning
Request timed out	The laptop sent the ping, but no reply was received because the device is no longer connected to the network.
Destination unreachable	The router or laptop cannot find a route to the device's IP address.

Practical observation

- Before disconnecting:

Ping replies were received successfully.

- After disconnecting:

The command displayed Request timed out and showed 100% packet loss.

Conclusion

After disconnecting the phone from the Wi-Fi network, I pinged its IP address again from the laptop. The ping command returned the error message Request timed out with 100% packet loss. This indicates that the target device was no longer reachable on the network because it had been disconnected from the Wi-Fi connection.
